COACHOS

Product Requirements Document — v0.1

Status: Draft · Scope: Phase 0–1 (concierge pilot → fully agentic Marketing Coach) · 24 Oct 2026

1 · Problem

> **The problem, in one statement:** AI at work isn't failing because the tools don't exist — it's failing because functional professionals are handed generic builders and generic courses, with nobody helping them turn their own expertise into agents they trust, own, and actually use.

> **In simple words:** Companies are giving people AI tools, but nobody sits with them and shows them how to use AI for their own daily work — so most people try it once or twice, and then stop.

Millions of functional professionals (marketers, HR, sales, ops) are being told to "use AI" but lack a path from generic chat tools to a working personal agent that saves them real hours. Platforms give them builders with blank text boxes; training vendors give them generic courses. The result: ~31% of employees sabotage or quietly avoid AI rollouts, and most user-built agents are abandoned within weeks. The failure is human (identity threat, intimidation, distrust), not technical — and nobody owns the layer that fixes it.

2 · Solution

CoachOS is a **coach agent** that guides a professional through creating, developing, and habitually using **their own function agent**. The coach doesn't build for the user — it teaches, in 5-minute in-workflow lessons, turning the user's own expertise (their best briefs, their checklists, their edits) into the agent's capabilities. The product is the loop: coach ↔ human ↔ function agent, instrumented end to end.

3 · Goals & success metrics

Goal	Metric	Phase 1 target
Users ship a working agent	% of onboarded users with a live function agent	≥ 60%
Agents stay alive	Week-4 retention of created agents	≥ 40%
Agents get better	Edit-rate on agent drafts (north star)	↓ ≥ 50% by week 8
Users get more skilled	Builder proficiency score progression	≥ 70% reach "Builder" level
Business works	Paying design partners	3–5 teams by end of Phase 1
Users love it	NPS	≥ 40

4 · Non-goals (Phase 0–1)

- Building a general-purpose agent platform or runtime (we sit on top of existing LLM APIs and tool connectors)
- Multi-function coaches (HR, sales) — Phase 2+
- Autonomous agents acting without human review — the review loop is core, not optional
- Marketplace of user-published agents — Phase 3
- Mobile native apps

5 · Personas

1. **The Ambitious Skeptic (primary):** 28–40, senior marketer/HRBP, uses ChatGPT casually, fears being left behind but resents "AI hype." Needs identity-safe framing and a fast first win.
2. **The Team Lead (buyer):** heads a 5–20 person function team, has a productivity mandate, no engineering resources. Buys on hours-saved ROI.
3. **The IT Gatekeeper (Phase 1.5):** needs visibility and guardrails; not a user but a veto holder.

6 · User experience — core flows

6.1 Onboarding (the 30-minute first win)

1. Coach interviews the user about their week; identifies the most painful recurring task.
2. User pastes an example of their best output for that task.
3. Coach generates a v0 function agent around that task; user sees a real draft of *their* real work within the session.
4. User edits the draft → first edit-loop signal captured → coach names what it learned.

6.2 Coaching sessions (ongoing)

- 5-minute embedded lessons triggered by telemetry, never scheduled courses.
- Named coaching moves (teach-by-example, Socratic prompt, template hand-over, build-then-explain) chosen by the tactics engine.
- Proficiency score visible: Novice → Builder → Architect, with unlocks.

6.3 Function agent daily use

- Morning queue: drafts awaiting review, completed tasks, scheduled jobs.
- Review UI where edits are first-class data, not a chore.
- "Improve me" panel: coach-suggested lessons derived from the agent's own failure patterns.

6.4 Anti-abandonment intervention

- Signals: usage drop, rising edit-rate, ignored outputs.
- Coach reaches out with a specific, small fix — not a generic nudge.

7 · Functional requirements (Phase 1 MVP)

ID	Requirement	Priority
F1	Coach chat interface with session memory and proficiency model	P0
F2	Agent builder flow: task definition, knowledge-source connection, tone/context cards	P0
F3	Review queue with edit capture (diff → training signal)	P0
F4	Proficiency scoring engine + levels	P0
F5	Coaching tactics engine (move selection, per-user)	P0
F6	Function-agent telemetry (usage, edit-rate, acceptance)	P0
F7	Intervention triggers + coach outreach	P1
F8	Team dashboard for the Team Lead (hours saved, proficiency map — non-punitive)	P1
F9	Knowledge connectors: Drive, Notion, email, CRM (2–3 to start)	P1
F10	Cross-user pattern library (anonymized, aggregated)	P2

8 · Learning-loop architecture

- **Coach loops:** session loop (per-user proficiency), tactics loop (per-function A/B), intervention loop (abandonment prediction).
- **Function-agent loops:** edit loop (north star), rating loop, task loop (detect manual repetition → propose new skill).
- **Meta-loop:** cross-user pattern library — the compounding moat. All loops logged as structured events from day one, even in the concierge phase when humans make the decisions.

9 · Technical approach (high level)

- LLM-agnostic orchestration layer; function agents compile to portable configs (system prompt + knowledge bindings + review policy), not locked to one vendor.
- Edit-capture via structured diffing in the review UI.
- Event log (every session, edit, rating, intervention) as the single source of truth for all learning loops.
- Phase 0 deliberately concierge: humans play the coach's harder decisions; every intervention is logged so the automation learns from human coaches.

10 · Business model

- Per-seat SaaS: ₹1,200–2,000 / $15–25 per user per month, sold to team leads on hours-saved ROI.
- Team tier adds dashboard + governance; enterprise tier (Phase 3) adds org graphs, SSO, audit.
- Graduated users convert to champions: referral mechanics spawn new coached seats (the churn antidote).

11 · Risks & mitigations

Risk	Severity	Mitigation
Platforms bundle coaching free (Microsoft, OpenAI)	High	Cross-platform neutrality; proficiency system + retention loops they don't have; depth in function expertise
User-built agents become shelfware	High	Intervention loop is a P0 feature; agent health telemetry from day one
Confused buyer slows sales	Medium	Sell to department heads on ROI; L&D expansion later
Governance blocks enterprise	Medium	Compliant-by-construction templates; IT-visible guardrails; no shadow-IT patterns
Domain expertise cold-start	Medium	One function deep (marketing) before any breadth; concierge phase generates the playbook
Graduation churn	Low-Med	Champion conversion; continuous agent-improvement coaching never graduates

12 · Open questions

1. Does the first wedge stay marketing, or does HR show stronger pain in pilot interviews? (Decide by end of Phase 0.)
2. Do users tolerate a 30-minute onboarding, or must the first win be under 10 minutes?
3. Pricing: per-seat vs. per-agent vs. outcome-based (hours saved)?
4. How much coach personality is right for enterprise buyers vs. individual prosumers?

13 · Milestones

Milestone	When
Concierge pilot live (10–20 marketing users)	Month 1
First 5 agents survive 4 weeks	Month 3
Fully agentic Marketing Coach (no human assist)	Month 6
3–5 paying design partners	Month 9
Phase 2 go/no-go (HR coach)	Month 9–10
